CENTRAL VACUUM SYSTEM

WHAT IS A CENTRAL VACUUM SYSTEM?

The HOMEVAC Central Vacuum System has a vacuum unit that can be conveniently placed in a concealed location like the garage or power room. It has a cleaning port in every room which is connected through a series of concealed vacuum pipes.

TYPES OF VACUUM PORTS

VACUUM RETRACTABLE HOSE

The VRH system is a long retractable hose concealed inside the vacuum pipes which can be pulled out, when you are cleaning and disappears back into your wall, when you are done.

INLET PORT

Vacuum Inlet Ports are placed on walls across your home. All you need to do is plug the hose into the port. The Vacuuming starts automatically, when the hose is plugged in and switches off, when the hose is un-plugged.

VACUUM PAN

Floor Vacuum Ports are installed at floor level at certain locations in your home. You can switch on this Port with a gentle tap of your feet. It is typically used in the Kitchen and any other location, where waste can be swept directly into the floor port.
